

# Exchanges, Brokers & Trading Bots

Feature 5 of 13 — a comparison table page for crypto exchanges and trading bots.

Live at deployment

Uses shared click tracking

No setup required

## 1 What this does

A new page at `/brokers` lists crypto exchanges (Binance, Bybit, OKX, Coinbase), trading bots (3Commas, Cryptohopper, Pionex), and charting tools (TradingView) in comparison tables grouped by category — fees, "best for," and a Visit button per row. It's linked in the site nav as "Exchanges & Bots" and included in the sitemap automatically.

## 2 Nothing to configure — but one thing to do before promoting it

### These links currently point at each platform's homepage, not an affiliate link

Exactly like the main tool catalog (see the main README's "Get your own affiliate links" section): join each exchange/bot's affiliate or referral program, then update the `url` field for that entry.

## 3 Where to edit it

All content lives in one file — no code knowledge needed to update it:

| File                              | Purpose                                                        |
|-----------------------------------|----------------------------------------------------------------|
| <code>data/brokers.json</code>    | Every row on the page — name, URL, fees, category, description |
| <code>app/brokers/page.tsx</code> | The page layout, if you want to change the design              |

To edit an entry: open `data/brokers.json`, find the platform by `"slug"`, and change its `"url"`, `"feeHighlight"`, or any other field. To add a new platform, copy an existing block and adjust the values — `"category"` controls which table section it appears under (a new category name automatically creates a new table).

## 4 How clicks are tracked

Every "Visit" button routes through `/go/[slug]` — the same click-tracked redirect the tool catalog uses (see the Feature 1 setup guide). No extra setup needed; it already works because `/go` checks both `data/products.json` and `data/brokers.json`.

## 5 Troubleshooting

| Problem | Fix |
|---------|-----|
|---------|-----|

---

New broker doesn't show up

Check the JSON is valid (no trailing comma, matching quotes) — a broken file will fail the site's build

---

Visit button 404s

The `slug` field must be unique across both `products.json` and `brokers.json`

---
