

Trading Calculators

Feature 6 of 13 — position size and compound interest calculators, both live already.

Zero configuration

Runs entirely in the browser

No API keys

1 What this does

Two interactive calculators, both already deployed and working with no setup:

Page	What it calculates
<code>/tools/position-size-calculator</code>	How many units to buy given account size, risk % per trade, entry price, and stop-loss price
<code>/tools/compound-interest-calculator</code>	Projected growth of a starting amount plus monthly contributions at a given return rate

Both live under a `/tools` index page, linked in the site nav as "Calculators," and both end in a call-to-action linking to your `/brokers` comparison page — turning a useful free tool into a lead into a paid signup.

2 Nothing to configure

These work immediately after deploying

All math runs client-side in the visitor's browser — no server calls, no API keys, no environment variables. There's nothing to set up.

3 Customizing

- **Change the CTA destination:** edit the "Ready to place the trade?" link in `app/tools/position-size-calculator/page.tsx` or `app/tools/compound-interest-calculator/page.tsx` — point it at a specific broker's `/go/[slug]` link instead of the general `/brokers` page if you want to push one platform.
- **Add another calculator:** the shared input/result styling lives in `components/calculators/shared.tsx` — copy the pattern in `PositionSizeCalculator.tsx` for a new one (e.g. a leverage or DCA calculator).

4 Where the code lives

File	Purpose
<code>app/tools/page.tsx</code>	Index page listing both calculators
<code>components/calculators/PositionSizeCalculator.tsx</code>	Position size logic + UI
<code>components/calculators/CompoundInterestCalculator.tsx</code>	Compound growth logic + UI
