

AI-Written Tool Review Pages

Feature 12 of 13 — long-form reviews for SEO and buyer confidence, 5 written already, 160 more ready to generate.

5 reviews included

Scale to the rest with your own API key

Never overwrites existing reviews

1 What this does

Five tools (Syllaby, Go High Level, Replit, Canva, Notion) already have an in-depth, balanced review — what the tool does, one genuine strength, one honest limitation, and a "best for" verdict — displayed on their tool page. A script scales this pattern to any other tool in your catalog using your own Anthropic API key.

Written honestly, on purpose

These reviews explicitly avoid inventing pricing, statistics, or competitor comparisons the tool's own description doesn't support. That's a deliberate constraint in the generation prompt — the goal is genuine buyer-helpful content, not hype copy that could damage trust if it turns out to be wrong.

2 Generate more reviews

1. Get an API key at console.anthropic.com (pay-as-you-go, no subscription).
2. Set `ANTHROPIC_API_KEY` in your environment.
3. Generate specific tools: `node scripts/generate-reviews.mjs syllaby canva notion`
4. Or generate all 160 remaining at once: `node scripts/generate-reviews.mjs --all`

Cost awareness

Each review is one API call to Claude Opus 5. Generating all 160 remaining tools at once will cost real money (a few dollars, not huge, but not free) — check console.anthropic.com for current pricing before running `--all`. Running it for specific tools a few at a time costs proportionally less and lets you review quality before scaling up.

3 How it avoids duplicate work

The script checks `data/reviews.json` before generating anything — a tool that already has a review (including the 5 written by hand) is always skipped, so you can re-run `--all` safely as you add new tools to the catalog without wasting API calls regenerating what's already there.

4 Editing a review

Every review is plain text in `data/reviews.json`, keyed by tool slug. Edit the `title` or `body` field directly — paragraphs are separated by a blank line in the JSON string.

5 Where the code lives

File	Purpose
<code>data/reviews.json</code>	All review content
<code>scripts/generate-reviews.mjs</code>	Generates new reviews via the Anthropic API
<code>lib/reviews.ts</code>	Reads the review data for a given tool
<code>app/tool/[slug]/page.tsx</code>	Renders the review section when one exists
