

Click Dashboard

Feature 10 of 13 — see which tools are actually getting clicked, password-protected.

- One password to set
- Also tracks email subscribers
- Free Upstash tier recommended

1 What this does

Every "Visit" click across the whole site (tools, brokers) now increments a counter. A private dashboard at `/admin/links` shows every tool sorted by click count, plus your email subscriber list underneath — one password-gated page for both.

2 Turn it on

- Set `ADMIN_DASHBOARD_PASSWORD` to anything you want (e.g. a random passphrase) as an environment variable.
- Redeploy (env var changes need a redeploy to take effect — this page is built to always check fresh, but the variable itself has to be present at deploy time).
- Visit `yourdomain.com/admin/links` and log in with that password.

Set up persistent storage or counts will reset

Without `UPSTASH_REDIS_REST_URL` / `UPSTASH_REDIS_REST_TOKEN` (free tier at [console.upstash.com](#)), click counts and subscriber emails are stored in a local file that most hosting providers wipe on every redeploy. The dashboard shows a visible warning banner whenever this isn't configured, so you'll always know which mode you're in.

3 Security note

This uses a simple shared-password cookie, not a hashed session or user accounts — appropriate for a low-stakes internal dashboard (click counts, email addresses you already collected) on a small personal site. Don't reuse this exact pattern for anything handling payment info or other sensitive data.

4 Where the code lives

File	Purpose
<code>app/go/[slug]/route.ts</code>	Increments the click counter on every outbound click
<code>app/admin/links/page.tsx</code>	Login form + the dashboard itself
<code>lib/admin-auth.ts</code>	Password check + cookie handling
<code>lib/kv.ts</code>	Where the counts and subscriber list are actually stored

Problem	Fix
Page says "not configured"	Set <code>ADMIN_DASHBOARD_PASSWORD</code> and redeploy
Login doesn't work	Double-check for typos/extra spaces in the password env var
Clicks show 0 even after testing	Confirm you clicked an actual <code>/go/...</code> link, not a direct link to the tool's site
Counts reset after a deploy	Set up Upstash — see the warning above
