

Auto-Generated "X vs Y" Comparison Pages

Feature 9 of 13 — 139 SEO pages generated automatically from your existing catalog data.

- 139 pages, zero manual writing
- No fabricated claims
- Auto-updates with your catalog

1 What this does

For every category, up to 6 tools (featured ones first) are paired up into every combination, generating a dedicated page at `/compare/tool-a-vs-tool-b` for each pair — 139 pages total today. Each page shows both tools side by side using their real descriptions and affiliate status — nothing is invented or guessed about features neither tool's description actually mentions.

Why capped at 6 tools per category?

Your largest category has 55 tools — pairing all of them would generate 1,485 pages just for that one category. Capping at 6 (featured tools prioritized) keeps the page count reasonable (139 total) while still covering your most important tools. Raise or lower `MAX_TOOLS_PER_CATEGORY` in `lib/comparisons.ts` if you want more or fewer.

2 Nothing to configure

These pages regenerate automatically on every deploy based on whatever's in `data/products.json` — mark more tools `"featured": true` and they'll start appearing in more comparison pairs automatically.

3 Where they're linked from

Each tool's own page (`/tool/[slug]`) shows "vs [other tool]" buttons for every comparison it's part of, so these pages aren't orphaned — they're discoverable from normal browsing, not just the sitemap.

4 Where the code lives

File	Purpose
<code>lib/comparisons.ts</code>	Generates the pairs and the shortlist-per-category logic
<code>app/compare/[pair]/page.tsx</code>	The comparison page layout
