

Email Capture + Drip Sequence

Feature 13 of 13 — homepage signup form, plus a ready-to-use 5-email welcome sequence.

Works with zero setup

ConvertKit integration built in

5-email sequence included

1 What this does

A signup form on the homepage collects email addresses. Right now (no email provider connected), addresses are safely stored and viewable on your `/admin/links` dashboard — but **no emails are actually sent** until you connect a real provider. Connect ConvertKit and it starts working immediately.

Important: addresses aren't emailed to anyone automatically yet

Without a connected provider, this only *collects* emails — it doesn't send anything. Follow step 2 below to actually start delivering the welcome sequence.

2 Connect ConvertKit (recommended path)

STEP 1

Create a form

Sign up at convertkit.com (free up to 1,000 subscribers), create a form, note its Form ID from the form's settings/embed code.

STEP 2

Set 2 env vars

`CONVERTKIT_API_KEY` (Account Settings → Developer) and `CONVERTKIT_FORM_ID`, then redeploy.

STEP 3

Load the sequence

In ConvertKit, create an Automation triggered by that form, and add the 5 emails from `docs/email-capture/drip-sequence.md` with the suggested delays.

3 Using a different provider

Using Mailchimp, IContact, or another provider instead? Edit the fallback block in `app/api/subscribe/route.ts` — swap the ConvertKit `fetch` call for that provider's API (most have a simple "add subscriber to list" REST endpoint). The email-collection form itself doesn't need any changes.

4 The 5-email sequence

Already written and ready to paste in: `docs/email-capture/drip-sequence.md`. Covers a welcome email, a mindset/how-to-use-this-list email, a highlight of an underrated category, a plug for the free tools, and a wrap-up that invites replies and points to your Telegram channel.

5 Where the code lives

File	Purpose
<code>components/EmailCapture.tsx</code>	The signup form UI
<code>app/api/subscribe/route.ts</code>	Handles submissions — ConvertKit or local storage fallback
<code>docs/email-capture/drip-sequence.md</code>	The 5 ready-to-paste emails
